

# Package ‘IsoplotR’

May 24, 2016

**Title** Statistical Toolbox for Radiometric Geochronology

**Version** 0.3

**Description** An R implementation of Ken Ludwig's popular Isoplot add-in to Microsoft Excel. Currently plots U-Pb data on Wetherill and Tera-Wasserburg concordia diagrams. Calculates concordia and discordia ages. Performs linear regression of measurements with correlated errors using the 'York' approach. Future versions will include functionality for the Ar-Ar, Rb-Sr, Sm-Nd, Re-Os, U-Th-He, fission track and cosmogenic nuclide methods, including isochrons, age spectra, ternary diagrams, kernel density estimates, radial plots, banana diagrams and multidimensional scaling plots. A graphical user interface is provided as an RStudio Shiny app.

**Author** Pieter Vermeesch [aut, cre]

**Maintainer** Pieter Vermeesch <p.vermeesch@ucl.ac.uk>

**Depends** R (>= 3.0.0)

**Imports** methods

**License** GPL-2

**LazyData** true

**RoxygenNote** 5.0.1

concordia.age

*Calculate U-Pb concordia ages*

---

## Description

Evaluates the equivalence of multiple ( $^{206}\text{Pb}/^{238}\text{U}$ - $^{207}\text{Pb}/^{235}\text{U}$  or  $^{207}\text{Pb}/^{206}\text{Pb}$ - $^{206}\text{Pb}/^{238}\text{U}$ ) compositions, computes the weighted mean isotopic composition and the corresponding concordia age using the method of maximum likelihood, computes the mswd of equivalence and concordance and their respective Chi-squared p-values.

## Usage

```
concordia.age(x, wetherill = TRUE, dcu = TRUE)
```

## Arguments

x	an object of class UPb
wetherill	boolean flag to indicate whether the data should be evaluated in Wetherill (TRUE) or Tera-Wasserburg (FALSE) space
dcu	propagate the decay constant uncertainties?

## Value

a list with the following items:

x: a named vector with the weighted mean U-Pb composition

x.cov: the covariance matrix of the mean U-Pb composition

age: the concordia age (in Ma)

age.err: the standard error of the concordia age

mswd: a list with two items (equivalence and concordance) containing the MSWD (Mean of the Squared Weighted Deviates, a.k.a the reduced Chi-squared statistic outside of geochronology) of isotopic equivalence and age concordance, respectively.

p.value: a list with two items (equivalence and concordance) containing the p-value of the Chi-square test for isotopic equivalence and age concordance, respectively.

## Examples

```
data(UPb)
fit <- concordia.age(UPb)
print(paste('age = ', fit$age, '+/-', fit$age.err, 'Ma, MSWD = ', fit$mswd))
```

---

concordia.plot	<i>Concordia diagram</i>
----------------	--------------------------

---

**Description**

Wetherill and Tera-Wasserburg concordia diagrams

**Usage**

```
concordia.plot(x, limits = NULL, alpha = 0.05, wetherill = TRUE,
  show.numbers = FALSE, ellipse.col = rgb(0, 1, 0, 0.5),
  concordia.col = "darksalmon", dcu = TRUE, show.age = 0)
```

**Arguments**

x	an object of class UPb
limits	age limits of the concordia line
alpha	confidence cutoff for the error ellipses
wetherill	boolean flag (FALSE for Tera-Wasserburg)
show.numbers	boolean flag (TRUE to show grain numbers)
ellipse.col	background colour of the error ellipses
concordia.col	colour of the concordia line
dcu	show decay constant uncertainty?
show.age	one of either 0: don't show the age 1: calculate the concordia age 2: fit a discordia line

**Examples**

```
data(UPb)
concordia.plot(UPb)
```

---

discordia.age	<i>Linear regression on a U-Pb concordia diagram</i>
---------------	--

---

**Description**

Performs linear regression of U-Pb data on Wetherill and Tera-Wasserburg concordia diagrams. Computes the upper and lower intercept ages (for Wetherill) or the lower intercept age and the  $^{207}\text{Pb}/^{206}\text{Pb}$  intercept (for Tera-Wasserburg), taking into account error correlations and decay constant uncertainties.

**Usage**

```
discordia.age(x, wetherill = TRUE, dcu = TRUE)
```

**Arguments**

x	an object of class UPb
wetherill	boolean flag to indicate whether the data should be evaluated in Wetherill (TRUE) or Tera-Wasserburg (FALSE) space
dcu	propagate the decay constant uncertainties?

**Value**

a list with the following items:

x: a two element vector with the upper and lower intercept ages (if wetherill==TRUE) or the lower intercept age and  $^{207}\text{Pb}/^{206}\text{Pb}$  intercept (for Tera-Wasserburg)

cov: the covariance matrix of the elements in x

**Examples**

```
data(UPb)
fit <- discordia.age(UPb)
print(paste('lower intercept = ', fit$x[1], '+/-', sqrt(fit$cov[1,1]), 'Ma'))
```

---

ellipse

*Get coordinates of error ellipse for plotting*

---

**Description**

Construct an error ellipse age a given confidence level from its centre and covariance matrix

**Usage**

```
ellipse(x, y, covmat, alpha = 0.05)
```

**Arguments**

x	x-coordinate (scalar) for the centre of the ellipse
y	y-coordinate (scalar) for the centre of the ellipse
covmat	covariance matrix of the x-y coordinates
alpha	the probability cutoff for the error ellipses

**Value**

a [50x2] matrix of plot coordinates

## Examples

```
x = 99; y = 101;
covmat <- matrix(c(1,0.9,0.9,1),nrow=2)
ell <- ellipse(x,y,covmat)
plot(c(90,110),c(90,110),type='l')
polygon(ell,col=rgb(0,1,0,0.5))
points(x,y,pch=21,bg='black')
```

I.R

*Isotopic ratios*

## Description

Gets or sets natural isotopic ratios.

## Usage

```
I.R(ratio, x = NULL, e = NULL)
```

## Arguments

ratio	one of either 'U238U235', 'Ar40Ar36', 'Ar38Ar36', 'Rb85Rb87', 'Sr88Sr86', 'Sr87Sr86', 'Sr84Sr86', 'Re185Re187', 'Os184Os192', 'Os186Os192', 'Os187Os192', 'Os188Os192', 'Os189Os192'
x	new value for ratio
e	new value for its standard error

## Value

if `x == e == NULL`, returns a two-item vector containing the mean value of the requested ratio and its standard error, respectively.

Examples

```
# returns the 238U/235U ratio of Hiess et al. (2012):
print(I.R('U238U235'))
# use the 238U/235U ratio of Steiger and Jaeger (1977):
I.R('U238U235',138.88,0)
print(I.R('U238U235'))
```

---

lambda	<i>Decay constants</i>
--------	------------------------

---

Description

Gets or sets the decay constants of radioactive istopes

Usage

```
lambda(nuclide, x = NULL, e = NULL)
```

Arguments

nuclide	the nuclide name
x	new value for the decay constant
e	new value for the decay constant uncertainty

Value

if x == e == NULL, returns a two-item vector containing the decay constant [in Ma-1] and its standard error, respectively.

Examples

```
print(lambda('U238'))
# use the decay constant of Kovarik and Adams (1932)
lambda('U238',0.0001537,0.0000068)
print(lambda('U238'))
```

---

read.data	<i>Read geochronology data</i>
-----------	--------------------------------

---

## Description

Cast a .csv file into one of IsoplotR's data classes

## Usage

```
read.data(fname, method = "U-Pb", format = 1, ...)
```

## Arguments

fname	file name (.csv format)
method	one of 'U-Pb', 'Ar-Ar', 'Rb-Sr', 'Sm-Nd', 'Re-Os', 'U-Th-He', 'fission tracks', 'cosmogenic nuclides' or 'other'
format	formatting option, depends on the value of method. If method = 'U-Pb', then format is one of either: 1: 7/6, s[7/6], 6/8, s[6/8], 7/5, s[7/5]
...	optional arguments to the read.csv function

## Value

an object of class 'UPb', 'ArAr', 'RbSr', 'SmNd', 'ReOs', 'UThHe', 'fission', 'cosmogenics', or 'other'

## Examples

```
# load one of the built-in .csv files:
fname <- system.file("UPb.csv", package="IsoplotR")
UPb <- read.data(fname, 'U-Pb')
concordia.plot(UPb)
```

---

read.matrix	<i>Read geochronology data</i>
-------------	--------------------------------

---

## Description

Cast a matrix into one of IsoplotR's data classes

## Usage

```
read.matrix(x, method = "U-Pb", format = 1)
```

**Arguments**

x	a matrix
method	see read.data for details
format	see read.data for details

**Value**

see read.data for details

**Examples**

```
# load one of the built-in .csv files:
fname <- system.file("UPb.csv",package="IsoplotR")
dat <- read.csv(fname,header=TRUE)
UPb <- read.matrix(dat,method='U-Pb',format=1)
concordia.plot(UPb)
```

---

 settings

---

*Load settings to and from json*

---

**Description**

Get and set preferred values for decay constants and isotopic abundances from and to a .json file format

**Usage**

```
settings(fname = NULL)
```

**Arguments**

fname	the path of a .json file
-------	--------------------------

**Value**

if fname==NULL, returns a .json string

**Examples**

```
json <- system.file("defaults.json",package="IsoplotR")
settings(json)
print(settings())
```

UPb

*An example U-Pb dataset***Description**

An example U-Pb dataset provided with Ludwig's Isoplot add-in

**Details**

UPb is an object of class UPb, i.e. a list with two items

x: a matrix formatted according to format

format: an integer defining the format of x. Options are:

1: 7/6, s[7/6], 6/8, s[6/8], 7/5, s[7/5]

**Author(s)**

Ken Ludwig and Pieter Vermeesch

**Examples**

```
data(UPb)
concordia.plot(UPb)
```

yorkfit

*Linear regression of X,Y-variables with correlated errors***Description**

Implements the unified regression algorithm of York et al. (2004) which, although based on least squares, yields results that are consistent with maximum likelihood estimates of Ludwig and Titterton (1994)

**Usage**

```
yorkfit(X, Y, sX, sY, rXY)
```

**Arguments**

X	vector of measurements
Y	vector of measurements
sX	standard errors of X
sY	standard errors of Y
rXY	correlation coefficients between X and Y

**Value**

a five element list containing  
 a: the intercept of the straight line fit  
 b: the slope of the fit  
 sa: the standard error of the intercept  
 sb: the standard error of the slope

**References**

Ludwig, K. R., and D. M. Titterington. "Calculation of  $^{230}\text{Th}/^{232}\text{Th}$  isochrons, ages, and errors." *Geochimica et Cosmochimica Acta* 58.22 (1994): 5031-5042.

York, Derek, et al. "Unified equations for the slope, intercept, and standard errors of the best straight line." *American Journal of Physics* 72.3 (2004): 367-375.

**Examples**

```
X <- c(1.550,12.395,20.445,20.435,20.610,24.900,
       28.530,50.540,51.595,86.51,106.40,157.35)
Y <- c(.7268,.7849,.8200,.8156,.8160,.8322,
       .8642,.9584,.9617,1.135,1.230,1.490)
n <- length(X)
sX <- X*0.01
sY <- Y*0.005
rXY <- rep(0.8,n)
fit <- yorkfit(X,Y,sX,sY,rXY)
covmat <- matrix(0,2,2)
plot(range(X),fit$a+fit$b*range(X),type='l',ylim=range(Y))
for (i in 1:n){
  covmat[1,1] <- sX[i]^2
  covmat[2,2] <- sY[i]^2
  covmat[1,2] <- rXY[i]*sX[i]*sY[i]
  covmat[2,1] <- covmat[1,2]
  ell <- ellipse(X[i],Y[i],covmat,alpha=0.05)
  polygon(ell)
}
```
