Package 'IsoplotR'

September 25, 2017

Title Statistical Toolbox for Radiometric Geochronology

Version 0.18

Description

An R implementation of Ken Ludwig's popular Isoplot add-in to Microsoft Excel. Plots U-Pb data on Wetherill and Tera-Wasserburg concordia diagrams. Calculates concordia and discordia ages. Performs linear regression of measurements with correlated errors using 'York', 'Titterington' and 'Ludwig' approaches. Generates Kernel Density Estimates (KDEs) and Cumulative Age Distributions (CADs). Produces Multidimensional Scaling (MDS) configurations and Shepard plots of multi-sample detrital datasets using the Kolmogorov-Smirnov distance as a dissimilarity measure. Calculates 40Ar/39Ar ages, isochrons, and age spectra. Computes weighted means accounting for overdispersion. Calculates U-Th-He (single grain and central) ages, logratio plots and ternary diagrams. Processes fission track data using the external detector method and LA-ICP-MS, calculates central ages and plots fission track and other data on radial (a.k.a. 'Galbraith' plots). Constructs total Pb-U, Pb-Pb, Re-Os, Sm-Nd, Lu-Hf, Rb-Sr and 230Th-U isochrons as well as 230Th-U evolution plots.

R topics documented:

age   *Calculate isotopic ages*

Description

Calculates ages and propagates their analytical uncertainties.

Usage

```
age(x, ...)

## Default S3 method:
age(x, method = "U238-Pb206", exterr = TRUE, J = c(NA,
  NA), zeta = c(NA, NA), rhoD = c(NA, NA), ...)

## S3 method for class 'UPb'
age(x, type = 1, wetherill = TRUE, exterr = TRUE, i = NA,
  sigdig = NA, common.Pb = 0, ...)

## S3 method for class 'PbPb'
age(x, isochron = TRUE, i2i = TRUE, exterr = TRUE,
  i = NA, sigdig = NA, ...)

## S3 method for class 'ArAr'
age(x, isochron = FALSE, i2i = TRUE, exterr = TRUE,
  i = NA, sigdig = NA, ...)

## S3 method for class 'UThHe'
age(x, central = FALSE, i = NA, sigdig = NA, ...)
```

```
## S3 method for class 'fissiontracks'
age(x, central = FALSE, i = NA, sigdig = NA,
  exterr = TRUE, ...)

## S3 method for class 'ThU'
age(x, isochron = FALSE, i2i = TRUE, exterr = TRUE,
  i = NA, sigdig = NA, ...)

## S3 method for class 'ReOs'
age(x, isochron = TRUE, i2i = TRUE, exterr = TRUE,
  i = NA, sigdig = NA, ...)

## S3 method for class 'SmNd'
age(x, isochron = TRUE, i2i = TRUE, exterr = TRUE,
  i = NA, sigdig = NA, ...)

## S3 method for class 'RbSr'
age(x, isochron = TRUE, i2i = TRUE, exterr = TRUE,
  i = NA, sigdig = NA, ...)

## S3 method for class 'LuHf'
age(x, isochron = TRUE, i2i = TRUE, exterr = TRUE,
  i = NA, sigdig = NA, ...)
```

Arguments

x   can be:

- a scalar containing an isotopic ratio,
- a two element vector containing an isotopic ratio and its standard error, or the spontaneous and induced track densities Ns and Ni (if method='fissiontracks'),
- a four element vector containing Ar40Ar39, s[Ar40Ar39], J, s[J],
- a six element vector containing U, s[U], Th, s[Th], He and s[He],
- an eight element vector containing U, s[U], Th, s[Th], He, s[He], Sm and s[Sm]
- a six element vector containing Rb, s[Rb], Sr, s[Sr], Sr87Sr86, and s[Sr87Sr86]
- a six element vector containing Re, s[Re], Os, s[Os], Os187Os188, and s[Os187Os188]
- a six element vector containing Sm, s[Sm], Nd, s[Nd], Nd143Nd144, and s[Nd144Nd143]
- a six element vector containing Lu, s[Lu], Hf, s[Hf], Hf176Hf177, and s[Hf176Hf177]
- a five element vector containing 0/8, s[0/8], 4/8, s[4/8] and cov[0/8,4/8]

OR

- an object of class UPb, PbPb, ArAr, ThU, RbSr, SmNd, ReOs, LuHf, UThHe or fissiontracks.

...	additional arguments
method	one of either `'U238-Pb206'`, `'U235-Pb207'`, `'Pb207-Pb206'`, `'Ar-Ar'`, `'Th-U'`, `'Re-Os'`, `'Sm-Nd'`, `'Rb-Sr'`, `'Lu-Hf'`, `'U-Th-He'` or `'fissiontracks'`
exterr	propagate the external (decay constant and calibration factor) uncertainties?
J	two-element vector with the J-factor and its standard error.
zeta	two-element vector with the zeta-factor and its standard error.
rhoD	two-element vector with the track density of the dosimeter glass and its standard error.
type	scalar flag indicating whether each U-Pb analysis should be considered separately (`type=1`), a concordia age should be calculated from all U-Pb analyses together (`type=2`), or a discordia line should be fit through all the U-Pb analyses (`type=3`).
wetherill	logical flag to indicate whether the data should be evaluated in Wetherill (`TRUE`) or Tera-Wasserburg (`FALSE`) space. This option is only used when `type=2`
i	(optional) index of a particular aliquot
sigdig	number of significant digits for the uncertainty estimate (only used if `type=1`, `isochron=FALSE` or `central=FALSE`).
common.Pb	apply a common lead correction using one of three methods: 1: use the isochron intercept as the initial Pb-composition 2: use the Stacey-Kramer two-stage model to infer the initial Pb-composition 3: use the Pb-composition stored in `settings('iratio','Pb206Pb204')` and `settings('iratio','Pb207Pb204')`
isochron	logical flag indicating whether each Ar-Ar analysis should be considered separately (`isochron=FALSE`) or an isochron age should be calculated from all Ar-Ar analyses together (`isochron=TRUE`).
i2i	'isochron to intercept': calculates the initial (aka 'inherited', 'excess', or 'common') $^{40}Ar/^{36}Ar$, $^{207}Pb/^{204}Pb$, $^{87}Sr/^{86}Sr$, $^{143}Nd/^{144}Nd$, $^{187}Os/^{188}Os$ or $^{176}Hf/^{177}Hf$ ratio from an isochron fit. Setting `i2i` to `FALSE` uses the default values stored in `settings('iratio',...)` or zero (for the Pb-Pb method). When applied to data of class ThU, setting `i2i` to `TRUE` applies a detrital Th-correction.
central	logical flag indicating whether each U-Th-He analysis should be considered separately (`central=FALSE`) or a central age should be calculated from all U-Th-He analyses together (`central=TRUE`).

Value

1. if x is a scalar or a vector, returns the age using the geochronometer given by `method` and its standard error.

2. if x has class UPb and `type=1`, returns a table with the following columns: `t.75`, `err[t.75]`, `t.68`, `err[t.68]`, `t.76`, `err[t.76]`, `t.conc`, `err[t.conc]`, containing the $^{207}Pb/^{235}U$-age and standard error, the $^{206}Pb/^{238}U$-age and standard error, the $^{207}Pb/^{206}Pb$-age and standard error, and the concordia age and standard error, respectively.

3. if x has class UPb and `type=2`, returns a list with the following items:

x a named vector with the (weighted mean) U-Pb composition

cov the covariance matrix of the (mean) U-Pb composition

age a 4-element vector with:

    t: the concordia age (in Ma)

    s[t]: the estimated uncertainty of t

    ci[t]: the 95% confidence interval of t for the appropriate degrees of freedom

    disp[t]: the 95% confidence interval for t augmented by $\sqrt{MSWD}$ to account for overdispersed datasets.

mswd a vector with three items (`equivalence`, `concordance` and `combined`) containing the MSWD (Mean of the Squared Weighted Deviates, a.k.a the reduced Chi-squared statistic outside of geochronology) of isotopic equivalence, age concordance and combined goodness of fit, respectively.

p.value a vector with three items (`equivalence`, `concordance` and `combined`) containing the p-value of the Chi-square test for isotopic equivalence, age concordance and combined goodness of fit, respectively.

df the number of degrees of freedom used for the `mswd` calculation. These values are useful when expanding the analytical uncertainties when `mswd>1`.

4. if x has class `UPb` and `type=3`, returns a list with the following items:

x a two element vector with the upper and lower intercept ages (if `wetherill=TRUE`) or the lower intercept age and ^{207}Pb/^{206}Pb intercept (for Tera-Wasserburg)

cov the covariance matrix of the elements in x

err a 3 x 2 matrix with the following rows:

    s: the estimated standard deviation for x

    ci: the 95% confidence interval of x for the appropriate degrees of freedom

    disp[t]: the 95% confidence interval for x augmented by $\sqrt{MSWD}$ to account for overdispersed datasets.

df the degrees of freedom of the concordia fit (concordance + equivalence)

p.value p-value of a Chi-square test for age homogeneity

mswd mean square of the weighted deviates – a goodness-of-fit measure. `mswd > 1` indicates overdispersion w.r.t the analytical uncertainties.

5. if x has class `PbPb`, `ArAr`, `RbSr`, `SmNd`, `ReOs`, `LuHf` and `isochron=FALSE`, returns a table of Pb-Pb, Ar-Ar, Rb-Sr, Sm-Nd, Re-Os or Lu-Hf and standard errors.

6. if x has class `PbPb`, `ArAr`, `RbSr`, `SmNd`, `ReOs` or `LuHf` and `isochron=TRUE`, returns a list with the following items:

a the intercept of the straight line fit and its standard error.

b the slope of the fit and its standard error.

cov.ab the covariance of the slope and intercept

mswd the mean square of the residuals (a.k.a 'reduced Chi-square') statistic

p.value the p-value of a Chi-square test for linearity

y0 a 4-element vector containing:

    t: the atmospheric ^{40}Ar/^{36}Ar or initial ^{207}Pb/^{204}Pb, ^{187}Os/^{188}Os, ^{87}Sr/^{86}Sr, ^{143}Nd/^{144}Nd or ^{176}Hf/^{177}Hf ratio.

    s[t]: the estimated standard deviation of t

    ci[t]: the 95% confidence interval of t for the appropriate degrees of freedom

    disp[t]: the 95% confidence interval for t augmented by $\sqrt{MSWD}$ to account for overdispersed datasets.

age a 4-element vector containing:

    y: the $^{207}Pb/^{206}Pb$, $^{40}Ar/^{39}Ar$, $^{187}Os/^{187}Re$, $^{87}Sr/^{86}Sr$, $^{143}Nd/^{144}Nd$ or $^{176}Hf/^{177}Hf$ age and its standard error.

    s[y]: the estimated standard deviation of y

    ci[y]: the 95% confidence interval of y for the appropriate degrees of freedom

    disp[y]: the 95% confidence interval for y augmented by $\sqrt{MSWD}$ to account for overdispersed datasets.

tfact the t-value for df degrees of freedom, which is used for the construction of ci[t] and ci[y]

df the degrees of freedom for the isochron fit

model copied from the input parameters

7. if x has class ThU and isochron=FALSE, returns a 5-column table with the Th-U ages, their standard errors, the initial $^{234}U/^{238}U$-ratios, their standard errors, and the correlation coefficient between the ages and the initial ratios.

8. if x has class ThU and isochron=TRUE, returns the output of an 'Osmond Type-II' isochron, i.e.:

par the best fitting $^{234}U/^{238}U$ intercept, $^{234}U/^{232}Th$ slope, $^{230}Th/^{238}U$ intercept and $^{230}Th/^{232}Th$ slope.

cov the covariance matrix of par.

a the $^{234}U/^{238}U$ intercept (i.e. the detrital Th-corrected value) and its standard error.

b the $^{234}U/^{232}Th$ slope and its standard error.

cov.ab the covariance of a and b.

mswd the mean square of the residuals (a.k.a 'reduced Chi-square') statistic.

p.value the p-value of a Chi-square test for linearity.

y0 a 4-element vector containing:

    y: the initial $^{234}U/^{238}U$-ratio

    s[y]: the estimated standard deviation of y

    ci[y]: the 95% confidence interval of y for the appropriate degrees of freedom

    disp[y]: the 95% confidence interval for y augmented by $\sqrt{MSWD}$ to account for overdispersed datasets.

age a 4-element vector containing:

    t: the Th-U isochron age

    s[t]: the estimated standard deviation of t

    ci[t]: the 95% confidence interval of t for the appropriate degrees of freedom

    disp[t]: the 95% confidence interval for t augmented by $\sqrt{MSWD}$ to account for overdispersed datasets.

df the degrees of freedom for the isochron fit.

tfact the t-value for df degrees of freedom

9. if x has class UThHe and central=TRUE, returns a list with the following items:

uvw a three-element list with the weighted mean log[U/He], log[Th/He] and log[Sm/He] compositions.

covmat a 3 x 3 covariance matrix for uvw

mswd the reduced Chi-square value for the log[U/He]-log[Th/He] compositions.

p.value the p-value of concordance between the log[U/He]-log[Th/He] compositions.

age a 4-element vector containing:

t: the central age age, i.e. the U-Th-He age corresponding to the composition given by uvw

s[t]: the estimated standard deviation of t

ci[t]: the 95% confidence interval of t for the appropriate degrees of freedom

disp[t]: the 95% confidence interval for t augmented by $\sqrt{MSWD}$ to account for overdispersed datasets.

df the degrees of freedom for the data fit.

tfact the t-value for df degrees of freedom

10. if x has class fissiontracks and central=FALSE, returns a table of fission track ages and standard errors.

11. if x has class fissiontracks and central=TRUE, returns a list with the following items:

mswd the reduced Chi-square value for the fission track ages.

p.value the p-value of concordance between the fission track ages.

age a three-element vector with the central age, its standard error and a 95% confidence interval for the appropriate degrees of freedom.

disp the (over)dispersion of the single grain ages beyond the formal analytical uncertainties.

df degrees of freedom for the Chi-square test

Examples

data(examples)
print(age(examples$UPb))
print(age(examples$UPb,type=1))
print(age(examples$UPb,type=2))
```

---

agespectrum   *Plot a (40Ar/39Ar) release spectrum*

Description

Produces a plot of boxes whose widths correspond to the cumulative amount of ^{39}Ar (or any other volume proxy), and whose heights express the analytical uncertainties. Only propagates the analytical uncertainty associated with decay constants and J-factors after computing the plateau composition.

Usage

```
agespectrum(x, ...)

## Default S3 method:
agespectrum(x, alpha = 0.05, plateau = TRUE,
  plateau.col = rgb(0, 1, 0, 0.5), non.plateau.col = rgb(0, 1, 1, 0.5),
  sigdig = 2, line.col = "red", lwd = 2, title = TRUE,
  xlab = "cumulative fraction", ylab = "age [Ma]", ...)
```

```
## S3 method for class 'ArAr'
agespectrum(x, alpha = 0.05, plateau = TRUE,
  plateau.col = rgb(0, 1, 0, 0.5), non.plateau.col = rgb(0, 1, 1, 0.5),
  sigdig = 2, exterr = TRUE, line.col = "red", lwd = 2, i2i = FALSE,
  ...)
```

Arguments

x	a three-column matrix whose first column gives the amount of ^{39}Ar in each aliquot, and whose second and third columns give the age and its uncertainty.
	OR
	an object of class `ArAr`
...	optional parameters to the generic `plot` function
alpha	the confidence limits of the error bars/boxes and confidence intervals.
plateau	logical flag indicating whether a plateau age should be calculated. If `plateau=TRUE`, the function will compute the weighted mean of the largest succession of steps that yield values passing the Chi-square test for age homogeneity. If TRUE, returns a list with plateau parameters.
plateau.col	the fill colour of the rectangles used to mark the steps belonging to the age plateau.
non.plateau.col	
	if `plateau=TRUE`, the steps that do NOT belong to the plateau are given a different colour.
sigdig	the number of significant digits of the numerical values reported in the title of the graphical output (only used if `plateau=TRUE`).
line.col	colour of the isochron line
lwd	line width
title	add a title to the plot?
xlab	x-axis label
ylab	y-axis label
exterr	propagate the external (decay constant and calibration factor) uncertainties?
i2i	'isochron to intercept': calculates the initial (aka 'inherited', 'excess', or 'common') ^{40}Ar/^{36}Ar ratio from an isochron fit. Setting `i2i` to FALSE uses the default values stored in `settings('iratio',...)`

Value

if `plateau=TRUE`, returns a list with the following items:

mean a 3-element vector with:

    x: the plateau mean

    s[x]: the estimated standard deviation of x

    ci[x]: the $100(1-\alpha)$% confidence interval of t for the appropriate degrees of freedom

disp a 2-element vector with:

> s: the standard deviation of the overdispersion
>
> ci: the $100(1-\alpha)$% confidence interval of the overdispersion for the appropriate degrees of freedom

df the degrees of freedom for the weighted mean plateau fit

mswd the mean square of the weighted deviates of the plateau

p.value the p-value of a Chi-square test with $df = n-2$ degrees of freedom, where n is the number of steps in the plateau and 2 degrees of freedom have been removed to estimate the mean and the dispersion.

fract the fraction of ^{39}Ar contained in the plateau

tfact the t-factor for df degrees of freedom evaluated at $100(1 - \alpha/2)$% confidence

plotpar plot parameters for the weighted mean, which are not used in the age spectrum

i indices of the steps that are retained for the plateau age calculation

Examples

```
data(examples)
agespectrum(examples$ArAr,ylim=c(0,80))
```

---

cad   *Plot continuous data as cumulative age distributions*

Description

Plot a dataset as a Cumulative Age Distribution (CAD), also known as a 'empirical cumulative distribution function'.

Usage

```
cad(x, ...)

## Default S3 method:
cad(x, pch = NA, verticals = TRUE, xlab = "age [Ma]",
  colmap = "heat.colors", col = "black", ...)

## S3 method for class 'detritals'
cad(x, pch = NA, verticals = TRUE, xlab = "age [Ma]",
  colmap = "heat.colors", ...)

## S3 method for class 'UPb'
cad(x, pch = NA, verticals = TRUE, xlab = "age [Ma]",
  col = "black", type = 4, cutoff.76 = 1100, cutoff.disc = c(-15, 5),
  common.Pb = 0, ...)

## S3 method for class 'PbPb'
```

```
cad(x, pch = NA, verticals = TRUE, xlab = "age [Ma]",
  col = "black", i2i = FALSE, ...)

## S3 method for class 'ArAr'
cad(x, pch = NA, verticals = TRUE, xlab = "age [Ma]",
  col = "black", i2i = FALSE, ...)

## S3 method for class 'ThU'
cad(x, pch = NA, verticals = TRUE, xlab = "age [ka]",
  col = "black", i2i = FALSE, ...)

## S3 method for class 'ReOs'
cad(x, pch = NA, verticals = TRUE, xlab = "age [Ma]",
  col = "black", i2i = TRUE, ...)

## S3 method for class 'SmNd'
cad(x, pch = NA, verticals = TRUE, xlab = "age [Ma]",
  col = "black", i2i = TRUE, ...)

## S3 method for class 'RbSr'
cad(x, pch = NA, verticals = TRUE, xlab = "age [Ma]",
  col = "black", i2i = TRUE, ...)

## S3 method for class 'LuHf'
cad(x, pch = NA, verticals = TRUE, xlab = "age [Ma]",
  col = "black", i2i = TRUE, ...)

## S3 method for class 'UThHe'
cad(x, pch = NA, verticals = TRUE, xlab = "age [Ma]",
  col = "black", ...)

## S3 method for class 'fissiontracks'
cad(x, pch = NA, verticals = TRUE,
  xlab = "age [Ma]", col = "black", ...)
```

Arguments

x	a numerical vector OR an object of class UPb, PbPb, ArAr, UThHe, fissiontracks, ReOs, RbSr, SmNd, LuHf, ThU or detritals
...	optional arguments to the generic plot function
pch	plot character to mark the beginning of each CAD step
verticals	logical flag indicating if the horizontal lines of the CAD should be connected by vertical lines
xlab	x-axis label
colmap	an optional string with the name of one of R's built-in colour palettes (e.g., heat.colors, terrain.colors, topo.colors, cm.colors), which are to be used for plotting data of class detritals.

col	colour to give to single sample datasets (not applicable if x has class `detritals`)
type	scalar indicating whether to plot the ^{207}Pb/^{235}U age (type=1), the ^{206}Pb/^{238}U age (type=2), the ^{207}Pb/^{206}Pb age (type=3), the ^{207}Pb/^{206}Pb-^{206}Pb/^{238}U age (type=4), or the (Wetherill) concordia age (type=5)
cutoff.76	the age (in Ma) below which the ^{206}Pb/^{238}U-age and above which the ^{207}Pb/^{206}Pb-age is used. This parameter is only used if `type=4`.
cutoff.disc	two element vector with the maximum and minimum percentage discordance allowed between the ^{207}Pb/^{235}U and ^{206}Pb/^{238}U age (if ^{206}Pb/^{238}U < cutoff.76) or between the ^{206}Pb/^{238}U and ^{207}Pb/^{206}Pb age (if ^{206}Pb/^{238}U > cutoff.76). Set `cutoff.disc=NA` if you do not want to use this filter.
common.Pb	apply a common lead correction using one of three methods:
	1: use the isochron intercept as the initial Pb-composition
	2: use the Stacey-Kramer two-stage model to infer the initial Pb-composition
	3: use the Pb-composition stored in `settings('iratio','Pb206Pb204')` and `settings('iratio','Pb207Pb204')`
i2i	'isochron to intercept': calculates the initial (aka 'inherited', 'excess', or 'common') ^{40}Ar/^{36}Ar, ^{207}Pb/^{204}Pb, ^{87}Sr/^{86}Sr, ^{143}Nd/^{144}Nd, ^{187}Os/^{188}Os or ^{176}Hf/^{177}Hf ratio from an isochron fit. Setting i2i to `FALSE` uses the default values stored in `settings('iratio',...)` or zero (for the Pb-Pb method). When applied to data of class `ThU`, setting i2i to `TRUE` applies a detrital Th-correction.

central	*Calculate U-Th-He and fission track central ages and compositions*

Description

Computes the geometric mean composition of a set of fission track or U-Th-He data and returns the corresponding age and fitting parameters.

Usage

```
central(x, ...)

## Default S3 method:
central(x, alpha = 0.05, ...)

## S3 method for class 'UThHe'
central(x, alpha = 0.05, ...)

## S3 method for class 'fissiontracks'
central(x, mineral = NA, alpha = 0.05, ...)
```

Arguments

x	an object of class UThHe or fissiontracks, OR a 2-column matrix with (strictly positive) values and uncertainties
...	optional arguments
alpha	cutoff value for confidence intervals
mineral	setting this parameter to either apatite or zircon changes the default efficiency factor, initial fission track length and density to preset values (only affects results if x$format=2.)

Value

if x has class UThHe, a list containing the following items:

age a four-element vector with:

t: the central age

s[t]: the standard error of s[t]

ci[t]: the $100(1-\alpha/2)\%$ confidence interval for t for the appropriate number of degrees of freedom

disp[t]: the $100(1-\alpha/2)\%$ confidence interval enhanced by a factor of $\sqrt{MSWD}$.

mswd the reduced Chi-square statistic of data concordance, i.e. $mswd = SS/df$, where SS is the sum of squares of the log[U/He]-log[Th/He] compositions

df the degrees of freedom ($2n-2$)

p.value the p-value of a Chi-square test with df degrees of freedom

uvw (if the input data table contains Sm) or **uv** (if it doesn't): the geometric mean log[U/He], log[Th/He] (, log[Sm/He]) and log[Sm/He] composition

covmat the covariance matrix of uvw or uv

tfact the $100(1-\alpha/2)\%$ percentile of the t- distribution for df degrees of freedom

OR, otherwise:

age a three-element vector with:

t: the central age

`s[t]`: the standard error of `s[t]`

`ci[t]`: the $100(1 - \alpha/2)\%$ confidence interval for `t` for the appropriate number of degrees of freedom

disp a two-element vector with the overdispersion (standard deviation) of the excess scatter, and the corresponding $100(1 - \alpha/2)\%$ confidence interval for the appropriate degrees of freedom.

mswd the reduced Chi-square statistic of data concordance, i.e. $mswd = X^2/df$, where X^2 is a Chi-square statistic of the EDM data or ages

df the degrees of freedom $(n - 2)$

p.value the p-value of a Chi-square test with `df` degrees of freedom

concordia   *Concordia diagram*

Description

Plots U-Pb data on Wetherill and Tera-Wasserburg concordia diagrams, calculate concordia ages and compositions, evaluates the equivalence of multiple (^{206}Pb/^{238}U-^{207}Pb/^{235}U or ^{207}Pb/^{206}Pb-^{206}Pb/^{238}U) compositions, computes the weighted mean isotopic composition and the corresponding concordia age using the method of maximum likelihood, computes the MSWD of equivalence and concordance and their respective Chi-squared p-values. Performs linear regression and computes the upper and lower intercept ages (for Wetherill) or the lower intercept age and the ^{207}Pb/^{206}Pb intercept (for Tera-Wasserburg), taking into account error correlations and decay constant uncertainties.

Usage

```
concordia(x, tlim = NULL, alpha = 0.05, wetherill = TRUE,
  show.numbers = FALSE, levels = NA, ellipse.col = c("#00FF0080",
  "#FF000080"), concordia.col = "darksalmon", exterr = TRUE, show.age = 0,
  sigdig = 2, common.Pb = 0, ticks = NULL, ...)
```

Arguments

x	an object of class UPb
tlim	age limits of the concordia line
alpha	probability cutoff for the error ellipses and confidence intervals
wetherill	logical flag (FALSE for Tera-Wasserburg)
show.numbers	logical flag (TRUE to show grain numbers)
levels	a vector with additional values to be displayed as different background colours within the error ellipses.
ellipse.col	a vector of two background colours for the error ellipses. If levels=NA, then only the first colour will be used. If levels is a vector of numbers, then ellipse.col is used to construct a colour ramp.
concordia.col	colour of the concordia line
exterr	show decay constant uncertainty?
show.age	one of either:
	0: just plot the data but don't calculate the age
	1: calculate the concordia age
	2: fit a discordia line
sigdig	number of significant digits for the concordia/discordia age
common.Pb	apply a common lead correction using one of three methods:
	1: use the isochron intercept as the initial Pb-composition
	2: use the Stacey-Kramer two-stage model to infer the initial Pb-composition
	3: use the Pb-composition stored in settings('iratio','Pb206Pb204') and settings('iratio','Pb207Pb204')
ticks	an optional vector of age ticks to be added to the concordia line.
...	optional arguments to the generic plot function

ellipse   *Get coordinates of error ellipse for plotting*

Description

Construct an error ellipse age a given confidence level from its centre and covariance matrix

Usage

```
ellipse(x, y, covmat, alpha = 0.05, n = 50)
```

Arguments

x	x-coordinate (scalar) for the centre of the ellipse
y	y-coordinate (scalar) for the centre of the ellipse
covmat	covariance matrix of the x-y coordinates
alpha	the probability cutoff for the error ellipses
n	the resolution of the error ellipses

Value

an [n x 2] matrix of plot coordinates

Examples

```
x = 99; y = 101;
covmat <- matrix(c(1,0.9,0.9,1),nrow=2)
ell <- ellipse(x,y,covmat)
plot(c(90,110),c(90,110),type='l')
polygon(ell,col=rgb(0,1,0,0.5))
points(x,y,pch=21,bg='black')
```

---

evolution   *Th-U evolution diagram*

Description

Plots Th-U data on a $^{234}U/^{238}U$-$^{230}Th/^{238}U$ evolution diagram, a $^{234}U/^{238}U$-age diagram, or (if $^{234}U/^{238}U$ is assumed to be in secular equilibrium), a $^{230}Th/^{232}Th$-$^{238}U/^{232}Th$ diagram, calculates isochron ages.

Usage

```
evolution(x, xlim = NA, ylim = NA, alpha = 0.05, transform = FALSE,
  detrital = FALSE, show.numbers = FALSE, levels = NA,
  ellipse.col = c("#00FF0080", "#FF000080"), line.col = "darksalmon",
  isochron = FALSE, exterr = TRUE, sigdig = 2, ...)
```

Arguments

x	an object of class ThU
xlim	x-axis limits
ylim	y-axis limits
alpha	probability cutoff for the error ellipses and confidence intervals
transform	if TRUE, plots ^{234}U/^{238}U vs. Th-U age.
detrital	apply a detrital Th correction by projecting the compositions along an isochron?
show.numbers	label the error ellipses with the grain numbers?
levels	a vector with additional values to be displayed as different background colours within the error ellipses.
ellipse.col	a vector of two background colours for the error ellipses. If levels=NA, then only the first colour will be used. If levels is a vector of numbers, then ellipse.col is used to construct a colour ramp.
line.col	colour of the age grid
isochron	fit a 3D isochron to the data?
exterr	propagate the decay constant uncertainty in the isochron age?
sigdig	number of significant digits for the isochron age
...	optional arguments to the generic plot function

examples   *Example datasets for testing* IsoplotR

Description

U-Pb, Pb-Pb, Ar-Ar, Re-Os, Sm-Nd, Rb-Sr, Lu-Hf, U-Th-He, Th-U, fission track and detrital datasets

Details

examples an 18-item list containing:

UPb: an object of class UPb containing a high precision U-Pb dataset of Kamo et al. (1996) packaged with Ken Ludwig's Isoplot program.

PbPb: an object of class PbPb containing a Pb-Pb dataset from Connelley et al. (2017).

DZ: an object of class detrital containing a detrital zircon U-Pb dataset from Namibia (Vermeesch et al., 2015).

ArAr: an object of class ArAr containing a ^{40}Ar/^{39}Ar spectrum of Skye basalt produced by Sarah Sherlock (Open University).

UThHe: an object of class UThHe containing a U-Th-Sm-He dataset of Fish Lake apatite produced by Daniel Stockli (UT Austin).

FT1: an object of class fissiontracks containing a synthetic external detector dataset.

FT2: an object of class fissiontracks containing a synthetic LA-ICP-MS-based fission track dataset using the zeta calibration method.

FT3: an object of class fissiontracks containing a synthetic LA-ICP-MS-based fission track dataset using the absolute dating approach.

ReOs: an object of class ReOs containing a ^{187}Os/^{187}Re-dataset from Selby (2007).

SmNd: an object of class SmNd containing a ^{143}Nd/^{147}Sm-dataset from Lugmair et al. (1975).

RbSr: an object of class RbSr containing an ^{87}Rb/^{86}Sr-dataset from Compston et al. (1971).

LuHf: an object of class LuHf containing an ^{176}Lu/^{177}Hf-dataset from Barfod et al. (2002).

ThU: an object of class ThU containing a synthetic 'Osmond-type' dataset from Titterington and Ludwig (1994).

Namib: an object of class detritals containing a detrital zircon U-Pb dataset of Vermeesch and Garzanti (2015).

average: an object of class other containing the ^{206}Pb/^{238}U-ages and errors of dataset UPb.

KDE: an object of class 'other' containing the ^{206}Pb/^{238}U-ages (but not the errors) of dataset UPb.

spectrum: an object of class 'other' containing the ^{39}Ar abundances, ^{40}Ar/^{39}Ar-ages and errors of dataset ArAr.

MountTom: an object of class 'other' containing a dataset of dispersed zircon fission track ages from Brandon and Vance (1992).

helioplot	*Visualise U-Th-He data on a logratio plot or ternary diagram*

Description

Plot U-Th(-Sm)-He data on a (log[He/Th] vs. log[U/He]) logratio plot or U-Th-He ternary diagram

Usage

```
helioplot(x, logratio = TRUE, show.central.comp = TRUE,
  show.numbers = FALSE, alpha = 0.05, contour.col = c("white", "red"),
  levels = NA, ellipse.col = c("#00FF0080", "#0000FF80"), sigdig = 2,
  xlim = NA, ylim = NA, fact = NA, ...)
```

Arguments

x	an object of class UThHe
logratio	Boolean flag indicating whether the data should be shown on bivariate log[He/Th] vs. log[U/He] diagramme, or a U-Th-He ternary diagramme.
show.central.comp	
	show the geometric mean composition as a white ellipse?
show.numbers	show the grain numbers inside the error ellipses?
alpha	probability cutoff for the error ellipses and confidence intervals
contour.col	two-element vector with the fill colours to be assigned to the minimum and maximum age contour
levels	a vector with additional values to be displayed as different background colours within the error ellipses.
ellipse.col	a vector of two background colours for the error ellipses. If levels=NA, then only the first colour will be used. If levels is a vector of numbers, then ellipse.col is used to construct a colour ramp.
sigdig	number of significant digits for the central age
xlim	optional limits of the x-axis (log[U/He]) of the logratio plot. If xlim=NA, the axis limits are determined automatically.
ylim	optional limits of the y-axis (log[Th/He]) of the logratio plot. If ylim=NA, the axis limits are determined automatically.
fact	three-element vector with the scaling factors of the ternary diagram if fact=NA, these will be determined automatically
...	optional arguments to the generic plot function

isochron   *Calculate and plot isochrons*

Description

Plots cogenetic Ar-Ar, Pb-Pb, Rb-Sr, Sm-Nd, Re-Os, Lu-Hf, U-Th-He or Th-U data as X-Y scatter-
plots, fits an isochron curve through them using the york function, and computes the corresponding
isochron age, including decay constant uncertainties.

Usage

```
isochron(x, ...)

## Default S3 method:
isochron(x, xlim = NA, ylim = NA, alpha = 0.05,
  sigdig = 2, show.numbers = FALSE, levels = NA,
  ellipse.col = c("#00FF0080", "#FF000080"), line.col = "red", lwd = 2,
  title = TRUE, model = 1, ...)

## S3 method for class 'ArAr'
isochron(x, xlim = NA, ylim = NA, alpha = 0.05,
  sigdig = 2, show.numbers = FALSE, levels = NA,
  ellipse.col = c("#00FF0080", "#FF000080"), inverse = TRUE,
  line.col = "red", lwd = 2, plot = TRUE, exterr = TRUE, model = 1,
  ...)

## S3 method for class 'PbPb'
isochron(x, xlim = NA, ylim = NA, alpha = 0.05,
  sigdig = 2, show.numbers = FALSE, levels = NA,
  ellipse.col = c("#00FF0080", "#FF000080"), inverse = TRUE,
  line.col = "red", lwd = 2, plot = TRUE, exterr = TRUE, model = 1,
  ...)

## S3 method for class 'RbSr'
isochron(x, xlim = NA, ylim = NA, alpha = 0.05,
  sigdig = 2, show.numbers = FALSE, levels = NA,
  ellipse.col = c("#00FF0080", "#FF000080"), line.col = "red", lwd = 2,
  plot = TRUE, exterr = TRUE, model = 1, ...)

## S3 method for class 'ReOs'
isochron(x, xlim = NA, ylim = NA, alpha = 0.05,
```

```
  sigdig = 2, show.numbers = FALSE, levels = NA,
  ellipse.col = c("#00FF0080", "#FF000080"), line.col = "red", lwd = 2,
  plot = TRUE, exterr = TRUE, model = 1, ...)

## S3 method for class 'SmNd'
isochron(x, xlim = NA, ylim = NA, alpha = 0.05,
  sigdig = 2, show.numbers = FALSE, levels = NA,
  ellipse.col = c("#00FF0080", "#FF000080"), line.col = "red", lwd = 2,
  plot = TRUE, exterr = TRUE, model = 1, ...)

## S3 method for class 'LuHf'
isochron(x, xlim = NA, ylim = NA, alpha = 0.05,
  sigdig = 2, show.numbers = FALSE, levels = NA,
  ellipse.col = c("#00FF0080", "#FF000080"), line.col = "red", lwd = 2,
  plot = TRUE, exterr = TRUE, model = 1, ...)

## S3 method for class 'ThU'
isochron(x, type = 2, xlim = NA, ylim = NA, alpha = 0.05,
  sigdig = 2, show.numbers = FALSE, levels = NA,
  ellipse.col = c("#00FF0080", "#FF000080"), line.col = "red", lwd = 2,
  plot = TRUE, exterr = TRUE, model = 1, ...)

## S3 method for class 'UThHe'
isochron(x, xlim = NA, ylim = NA, alpha = 0.05,
  sigdig = 2, show.numbers = FALSE, line.col = "red", lwd = 2,
  plot = TRUE, model = 1, ...)
```

Arguments

x	EITHER a matrix with the following five columns:
	X the x-variable
	sX the standard error of X
	Y the y-variable
	sY the standard error of Y
	rXY the correlation coefficient of X and Y
	OR
	an object of class ArAr, PbPb, ReOs, RbSr, SmNd, LuHf, UThHe or ThU.
...	optional arguments to be passed on to the generic plot function if model=2
xlim	2-element vector with the plot limits of the x-axis
ylim	2-element vector with the plot limits of the y-axis
alpha	confidence cutoff for the error ellipses and confidence intervals
sigdig	the number of significant digits of the numerical values reported in the title of the graphical output
show.numbers	logical flag (TRUE to show grain numbers)
levels	a vector with additional values to be displayed as different background colours within the error ellipses.

ellipse.col	a vector of two background colours for the error ellipses. If `levels=NA`, then only the first colour will be used. If `levels` is a vector of numbers, then `ellipse.col` is used to construct a colour ramp.
line.col	colour of the isochron line
lwd	line width
title	add a title to the plot?
model	construct the isochron using either:

      1. Error weighted least squares regression
      2. Ordinary least squares regression

inverse	if `TRUE` and x has class `ArAr`, plots ^{36}Ar/^{40}Ar vs. ^{39}Ar/^{40}Ar.
	if `TRUE` and x has class `PbPb`, plots ^{207}Pb/^{206}Pb vs. ^{204}Pb/^{206}Pb.
plot	if `FALSE`, suppresses the graphical output
exterr	propagate external sources of uncertainty (J, decay constant)?
type	following the classification of Ludwig and Titterington (1994), one of either:

      1. 'Rosholt type-II' isochron, setting out ^{230}Th/^{232}Th vs. ^{238}U/^{232}Th
      2. 'Osmond type-II' isochron, setting out ^{230}Th/^{238}U vs. ^{232}Th/^{238}U
      3. 'Rosholt type-II' isochron, setting out ^{234}U/^{232}Th vs. ^{238}U/^{232}Th
      4. 'Osmond type-II' isochron, setting out ^{234}U/^{238}U vs. ^{232}Th/^{238}U

Value

if x has class `PbPb`, `ArAr`, `RbSr`, `SmNd`, `ReOs` or `LuHf`, or `UThHe`, returns a list with the following items:

a the intercept of the straight line fit and its standard error.

b the slope of the fit and its standard error.

cov.ab the covariance of the slope and intercept

df the degrees of freedom of the linear fit ($df = n - 2$)

y0 a four-element list containing:

    y: the atmospheric ^{40}Ar/^{36}Ar or initial ^{207}Pb/^{204}Pb, ^{187}Os/^{188}Os, ^{87}Sr/^{86}Sr, ^{143}Nd/^{144}Nd or ^{176}Hf/^{177}Hf ratio.

    s[y]: the propagated uncertainty of y

    ci[y]: the $100(1-\alpha/2)\%$ confidence interval for y given the appropriate degrees of freedom.

    disp[y]: the $100(1-\alpha/2)\%$ confidence interval for y enhanced by $\sqrt{mswd}$ (only applicable if `model=1`).

age a four-element list containing:

    t: the ^{207}Pb/^{206}Pb, ^{40}Ar/^{39}Ar, ^{187}Os/^{187}Re, ^{87}Sr/^{86}Sr, ^{143}Nd/^{144}Nd or ^{176}Hf/^{177}Hf age.

    s[t]: the propagated uncertainty of t

    ci[t]: the $100(1-\alpha/2)\%$ confidence interval for t given the appropriate degrees of freedom.

    disp[t]: the $100(1-\alpha/2)\%$ confidence interval for t enhanced by $\sqrt{mswd}$ (only applicable if `model=1`).

tfact the $100(1-\alpha/2)\%$ percentile of a t-distribution with df degrees of freedom.

additionally, if model=1:

mswd the mean square of the residuals (a.k.a 'reduced Chi-square') statistic (omitted if model=2).

p.value the p-value of a Chi-square test for linearity

OR, if x has class ThU:

par if type=1 or type=3: the best fitting ^{230}Th/^{232}Th intercept, ^{230}Th/^{238}U slope, ^{234}U/^{232}Th intercept and ^{234}U/^{238}U slope, OR, if type=2 or type=4: the best fitting ^{234}U/^{238}U intercept, ^{230}Th/^{232}Th slope, ^{234}U/^{238}U intercept and ^{234}U/^{232}Th slope.

cov the covariance matrix of par.

df the degrees of freedom for the linear fit, i.e. $(3n-3)$ if x$format=1 or x$format=2, and $(2n-2)$ if x$format=3 or x$format=4

a if type=1: the ^{230}Th/^{232}Th intercept; if type=2: the ^{230}Th/^{238}U intercept; if type=3: the ^{234}Th/^{232}Th intercept; if type=4: the ^{234}Th/^{238}U intercept and its propagated uncertainty.

b if type=1: the ^{230}Th/^{238}U slope; if type=2: the ^{230}Th/^{232}Th slope; if type=3: the ^{234}U/^{238}U slope; if type=4: the ^{234}U/^{232}Th slope and its propagated uncertainty.

cov.ab the covariance between a and b.

mswd the mean square of the residuals (a.k.a 'reduced Chi-square') statistic.

p.value the p-value of a Chi-square test for linearity.

y0 a four-element vector containing:

y: the initial ^{234}U/^{238}U-ratio

s[y]: the propagated uncertainty of y

ci[y]: the $100(1 - \alpha/2)\%$ confidence interval for y

disp[y]: the $100(1 - \alpha/2)\%$ confidence interval for y enhanced by $\sqrt{mswd}$.

age a four-element vector containing:

t: the initial ^{234}U/^{238}U-ratio

s[t]: the propagated uncertainty of t

ci[t]: the $100(1 - \alpha/2)\%$ confidence interval for t

disp[t]: the $100(1 - \alpha/2)\%$ confidence interval for t enhanced by $\sqrt{mswd}$.

d a matrix with the following columns: the X-variable for the isochron plot, the analytical uncertainty of X, the Y-variable for the isochron plot, the analytical uncertainty of Y, and the correlation coefficient between X and Y.

xlab the x-label of the isochron plot

ylab the y-label of the isochron plot

IsoplotR   *library(IsoplotR)*

Description

`IsoplotR` is a toolkit for isotope geochronology. Plots U-Pb data on Wetherill and Tera-Wasserburg concordia diagrams. Calculates concordia and discordia ages. Performs linear regression of measurements with correlated errors using 'York', 'Titterington' and 'Ludwig' approaches. Generates Kernel Density Estimates (KDEs) and Cumulative Age Distributions (CADs). Produces Multidimensional Scaling (MDS) configurations and Shepard plots of multi-sample detrital datasets using the Kolmogorov-Smirnov distance as a dissimilarity measure. Calculates ^{40}Ar/^{39}Ar ages, isochrons, and age spectra. Computes weighted means accounting for overdispersion. Calculates U-Th-He (single grain and central) ages, logratio plots and ternary diagrams. Processes fission track data using the external detector method and LA-ICP-MS, calculates central ages and plots fission track and other data on radial (a.k.a. 'Galbraith' plots). Constructs total Pb-U, Pb-Pb, Re-Os, Sm-Nd, Lu-Hf, Rb-Sr and ^{230}Th-U isochrons as well as ^{230}Th-U evolution plots.

Details

A list of documented functions may be viewed by typing `help(package='IsoplotR')`. Detailed instructions are provided at <http://isoplotr.london-geochron.com>. A manuscript with the theoretical background is in preparation.

  hist.col = rgb(0, 1, 0, 0.2), show.hist = TRUE, bty = "n",
  binwidth = NA, ncol = NA, ...)
```

Arguments

x	a vector of numbers OR an object of class `UPb`, `PbPb`, `ArAr`, `ReOs`, `SmNd`, `RbSr`, `UThHe`, `fissiontracks`, `ThU` or `detrital`
...	optional arguments to be passed on to `density`
from	minimum age of the time axis. If `NULL`, this is set automatically
to	maximum age of the time axis. If `NULL`, this is set automatically
bw	the bandwidth of the KDE. If `NULL`, `bw` will be calculated automatically using `botev()`
adaptive	logical flag controlling if the adaptive KDE modifier of Abramson (1982) is used
log	transform the ages to a log scale if `TRUE`
n	horizontal resolution of the density estimate
plot	show the KDE as a plot
pch	the symbol used to show the samples. May be a vector. Set `pch=NA` to turn them off.
xlab	the x-axis label
ylab	the y-axis label
kde.col	the fill colour of the KDE specified as a four element vector of `r`, `g`, `b`, `alpha` values
hist.col	the fill colour of the histogram specified as a four element vector of r, g, b, alpha values
show.hist	logical flag indicating whether a histogram should be added to the KDE
bty	change to `"o"`, `"l"`, `"7"`, `"c"`, `"u"`, or `"]"` if you want to draw a box around the plot
binwidth	scalar width of the histogram bins, in Myr if `x$log = FALSE`, or as a fractional value if `x$log = TRUE`. Sturges' Rule is used if `binwidth = NA`
ncol	scalar value indicating the number of columns over which the KDEs should be divided. This option is only used if x has class `detritals`.
type	scalar indicating whether to plot the $^{207}Pb/^{235}U$ age (type=1), the $^{206}Pb/^{238}U$ age (type=2), the $^{207}Pb/^{206}Pb$ age (type=3), the $^{207}Pb/^{206}Pb$-$^{206}Pb/^{238}U$ age (type=4), or the (Wetherill) concordia age (type=5)
cutoff.76	the age (in Ma) below which the $^{206}Pb/^{238}U$ and above which the $^{207}Pb/^{206}Pb$ age is used. This parameter is only used if `type=4`.
cutoff.disc	two element vector with the maximum and minimum percentage discordance allowed between the $^{207}Pb/^{235}U$ and $^{206}Pb/^{238}U$ age (if $^{206}Pb/^{238}U$ < `cutoff.76`) or between the $^{206}Pb/^{238}U$ and $^{207}Pb/^{206}Pb$ age (if $^{206}Pb/^{238}U$ > `cutoff.76`). Set `cutoff.disc=NA` if you do not want to use this filter.
common.Pb	apply a common lead correction using one of three methods:
	1: use the isochron intercept as the initial Pb-composition
	2: use the Stacey-Kramer two-stage model to infer the initial Pb-composition
	3: use the Pb-composition stored in `settings('iratio','Pb206Pb204')` and `settings('iratio','Pb207Pb204')`

samebandwidth	logical flag indicating whether the same bandwidth should be used for all samples. If samebandwidth = TRUE and bw = NULL, then the function will use the median bandwidth of all the samples.
normalise	logical flag indicating whether or not the KDEs should all integrate to the same value.
i2i	'isochron to intercept': calculates the initial (aka 'inherited', 'excess', or 'common') $^{40}Ar/^{36}Ar$, $^{207}Pb/^{204}Pb$, $^{87}Sr/^{86}Sr$, $^{143}Nd/^{144}Nd$, $^{187}Os/^{188}Os$ or $^{176}Hf/^{177}Hf$ ratio from an isochron fit. Setting i2i to FALSE uses the default values stored in settings('iratio',...) or zero (for the Pb-Pb method). When applied to data of class ThU, setting i2i to TRUE applies a detrital Th-correction.

Value

if plot = TRUE, returns an object of class KDE, i.e. a list containing the following items:

x horizontal plot coordinates

y vertical plot coordinates

bw the base bandwidth of the density estimate

ages the data values from the input to the kde function

or, if x has class =detritals, an object of class KDEs, i.e. a list containing the following items:

kdes a named list with objects of class KDE

from the beginning of the common time scale

to the end of the common time scale

themax the maximum probability density of all the KDEs

xlabel the x-axis label to be used by plot.KDEs

ludwig	*Linear regression of X,Y,Z-variables with correlated errors, taking into account decay constant uncertainties.*

Description

Implements the maximum likelihood algorithm of Ludwig (1998)

Usage

```
ludwig(x, ...)

## Default S3 method:
ludwig(x, ...)

## S3 method for class 'UPb'
ludwig(x, exterr = FALSE, alpha = 0.05, ...)
```

Arguments

x	an object of class UPb
...	optional arguments
exterr	propagate external sources of uncertainty (e.g., decay constant)?
alpha	cutoff value for confidence intervals

Value

par a two-element vector with the lower concordia intercept and initial ^{207}Pb/^{206}Pb-ratio.

cov the covariance matrix of par

df the degrees of freedom of the model fit ($3n - 3$, where n is the number of aliquots).

mswd the mean square of weighted deviates (a.k.a. reduced Chi-square statistic) for the fit.

p.value p-value of a Chi-square test for the linear fit

mds   *Multidimensional Scaling*

Description

Performs classical or nonmetric Multidimensional Scaling analysis

Usage

```
mds(x, ...)

## Default S3 method:
mds(x, classical = FALSE, plot = TRUE, shepard = FALSE,
  nnlines = FALSE, pos = NULL, col = "black", bg = "white", xlab = "",
  ylab = "", ...)

## S3 method for class 'detritals'
mds(x, classical = FALSE, plot = TRUE,
  shepard = FALSE, nnlines = FALSE, pos = NULL, col = "black",
  bg = "white", xlab = "", ylab = "", ...)
```

Arguments

x	a dissimilarity matrix OR an object of class `detrital`
...	optional arguments to the generic `plot` function
classical	logical flag indicating whether classical (`TRUE`) or nonmetric (`FALSE`) MDS should be used
plot	show the MDS configuration (if shepard=FALSE) or Shepard plot (if shepard=TRUE) on a graphical device
shepard	logical flag indicating whether the graphical output should show the MDS configuration (shepard=FALSE) or a Shepard plot with the 'stress' value. This argument is only used if plot=TRUE.
nnlines	if `TRUE`, draws nearest neighbour lines
pos	a position specifier for the labels (if pch!=NA). Values of 1, 2, 3 and 4 indicate positions below, to the left of, above and to the right of the MDS coordinates, respectively.
col	plot colour (may be a vector)
bg	background colour (may be a vector)
xlab	a string with the label of the x axis
ylab	a string with the label of the y axis

Value

returns an object of class MDS, i.e. a list containing the following items:

points a two column vector of the fitted configuration

classical a logical flag indicating whether the MDS configuration was obtained by classical (TRUE) or nonmetric (FALSE) MDS

diss the dissimilarity matrix used for the MDS analysis

stress (only if `classical=TRUE`) the final stress achieved (in percent)

peakfit   *Finite mixture modelling of geochronological datasets*

Description

Implements the discrete mixture modelling algorithms of Galbraith and Green (1993) and applies them to fission track and other geochronological datasets.

Usage

```
peakfit(x, ...)

## Default S3 method:
peakfit(x, k = "auto", sigdig = 2, log = TRUE,
  alpha = 0.05, ...)

## S3 method for class 'fissiontracks'
peakfit(x, k = 1, exterr = TRUE, sigdig = 2,
  log = TRUE, alpha = 0.05, ...)

## S3 method for class 'UPb'
peakfit(x, k = 1, type = 4, cutoff.76 = 1100,
  cutoff.disc = c(-15, 5), exterr = TRUE, sigdig = 2, log = TRUE,
  alpha = 0.05, ...)

## S3 method for class 'PbPb'
```

```
peakfit(x, k = 1, exterr = TRUE, sigdig = 2, log = TRUE,
  i2i = TRUE, alpha = 0.05, ...)

## S3 method for class 'ArAr'
peakfit(x, k = 1, exterr = TRUE, sigdig = 2, log = TRUE,
  i2i = FALSE, alpha = 0.05, ...)

## S3 method for class 'ReOs'
peakfit(x, k = 1, exterr = TRUE, sigdig = 2, log = TRUE,
  i2i = TRUE, alpha = 0.05, ...)

## S3 method for class 'SmNd'
peakfit(x, k = 1, exterr = TRUE, sigdig = 2, log = TRUE,
  i2i = TRUE, alpha = 0.05, ...)

## S3 method for class 'RbSr'
peakfit(x, k = 1, exterr = TRUE, sigdig = 2, log = TRUE,
  i2i = TRUE, alpha = 0.05, ...)

## S3 method for class 'LuHf'
peakfit(x, k = 1, exterr = TRUE, sigdig = 2, log = TRUE,
  i2i = TRUE, alpha = 0.05, ...)

## S3 method for class 'ThU'
peakfit(x, k = 1, exterr = FALSE, sigdig = 2, log = TRUE,
  i2i = TRUE, alpha = 0.05, ...)

## S3 method for class 'UThHe'
peakfit(x, k = 1, sigdig = 2, log = TRUE, alpha = 0.05,
  ...)
```

Arguments

x	either a [2 x n] matrix with measurements and their standard errors, or an object of class fissiontracks, UPb, PbPb, ArAr, ReOs, SmNd, RbSr, LuHf, ThU or UThHe
...	optional arguments (not used)
k	the number of discrete age components to be sought. Setting this parameter to 'auto' automatically selects the optimal number of components (up to a maximum of 5) using the Bayes Information Criterion (BIC).
sigdig	number of significant digits to be used for any legend in which the peak fitting results are to be displayed.
log	take the logs of the data before applying the mixture model?
alpha	cutoff value for confidence intervals
exterr	propagate the external sources of uncertainty into the component age errors?
type	scalar indicating whether to plot the $^{207}Pb/^{235}U$ age (type=1), the $^{206}Pb/^{238}U$ age (type=2), the $^{207}Pb/^{206}Pb$ age (type=3), the $^{207}Pb/^{206}Pb$-$^{206}Pb/^{238}U$ age

(type=4), or the (Wetherill) concordia age (type=5)

cutoff.76   the age (in Ma) below which the ^{206}Pb/^{238}U and above which the ^{207}Pb/^{206}Pb age is used. This parameter is only used if type=4.

cutoff.disc   two element vector with the maximum and minimum percentage discordance allowed between the ^{207}Pb/^{235}U and ^{206}Pb/^{238}U age (if ^{206}Pb/^{238}U < cutoff.76) or between the ^{206}Pb/^{238}U and ^{207}Pb/^{206}Pb age (if ^{206}Pb/^{238}U > cutoff.76). Set cutoff.disc=NA if you do not want to use this filter.

i2i   'isochron to intercept': calculates the initial (aka 'inherited', 'excess', or 'common') ^{40}Ar/^{36}Ar, ^{207}Pb/^{204}Pb, ^{87}Sr/^{86}Sr, ^{143}Nd/^{144}Nd, ^{187}Os/^{188}Os or ^{176}Hf/^{177}Hf ratio from an isochron fit. Setting i2i to FALSE uses the default values stored in settings('iratio',...) or zero (for the Pb-Pb method). When applied to data of class ThU, setting i2i to TRUE applies a detrital Th-correction.

Value

returns a list with the following items:

peaks a 3 x k matrix with the following rows:

     t: the ages of the k peaks

     s[t]: the estimated uncertainties of t

     ci[t]: the $100(1 - \alpha/2)\%$ confidence interval for t

props a 2 x k matrix with the following rows:

     p: the proportions of the k peaks

     s[p]: the estimated uncertainties of p

L the log-likelihood of the fit

tfact the $100(1 - \alpha/2)\%$ percentile of the t-distribution with $(n - 2k + 1)$ degrees of freedom

legend a vector of text expressions to be used in a figure legend

radialplot   *Visualise heteroscedastic data on a radial plot*

Description

Implementation of a graphical device developed by Rex Galbraith to display several estimates of the same quantity that have different standard errors.

Usage

```
radialplot(x, ...)

## Default S3 method:
radialplot(x, from = NA, to = NA, t0 = NA,
  transformation = "log", sigdig = 2, show.numbers = FALSE, pch = 21,
  levels = NA, bg = c("white", "red"), title = TRUE, k = 0,
  markers = NULL, alpha = 0.05, ...)

## S3 method for class 'fissiontracks'
radialplot(x, from = NA, to = NA, t0 = NA,
  transformation = "arcsin", sigdig = 2, show.numbers = FALSE, pch = 21,
  levels = NA, bg = c("white", "red"), title = TRUE, markers = NULL,
  k = 0, exterr = TRUE, alpha = 0.05, ...)

## S3 method for class 'UPb'
radialplot(x, from = NA, to = NA, t0 = NA,
  transformation = "log", type = 4, cutoff.76 = 1100,
  cutoff.disc = c(-15, 5), show.numbers = FALSE, pch = 21, levels = NA,
  bg = c("white", "red"), markers = NULL, k = 0, exterr = TRUE,
  common.Pb = 0, alpha = 0.05, ...)

## S3 method for class 'PbPb'
radialplot(x, from = NA, to = NA, t0 = NA,
  transformation = "log", show.numbers = FALSE, pch = 21, levels = NA,
  bg = c("white", "red"), markers = NULL, k = 0, exterr = TRUE,
  i2i = TRUE, alpha = 0.05, ...)

## S3 method for class 'ArAr'

  bg = c("white", "red"), markers = NULL, k = 0, alpha = 0.05, ...)
```

```
## S3 method for class 'ReOs'
radialplot(x, from = NA, to = NA, t0 = NA,
  transformation = "log", show.numbers = FALSE, pch = 21, levels = NA,
  bg = c("white", "red"), markers = NULL, k = 0, exterr = TRUE,
  i2i = TRUE, alpha = 0.05, ...)

## S3 method for class 'SmNd'
radialplot(x, from = NA, to = NA, t0 = NA,
  transformation = "log", show.numbers = FALSE, pch = 21, levels = NA,
  bg = c("white", "red"), markers = NULL, k = 0, exterr = TRUE,
  i2i = TRUE, alpha = 0.05, ...)

## S3 method for class 'RbSr'
radialplot(x, from = NA, to = NA, t0 = NA,
  transformation = "log", show.numbers = FALSE, pch = 21, levels = NA,
  bg = c("white", "red"), markers = NULL, k = 0, exterr = TRUE,
  i2i = TRUE, alpha = 0.05, ...)

## S3 method for class 'LuHf'
radialplot(x, from = NA, to = NA, t0 = NA,
  transformation = "log", show.numbers = FALSE, pch = 21, levels = NA,
  bg = c("white", "red"), markers = NULL, k = 0, exterr = TRUE,
  i2i = TRUE, alpha = 0.05, ...)

## S3 method for class 'ThU'
radialplot(x, from = NA, to = NA, t0 = NA,
  transformation = "log", show.numbers = FALSE, pch = 21, levels = NA,
  bg = c("white", "red"), markers = NULL, k = 0, i2i = TRUE,
  alpha = 0.05, ...)
```

Arguments

x	Either an nx2 matix of (transformed) values z and their standard errors s OR
	and object of class `fissiontracks`, `UThHe`, `ArAr`, `ReOs`, `SmNd`, `RbSr`, `LuHf`, `ThU`, `PbPb` or `UPb`
...	additional arguments to the generic `points` function
from	minimum age limit of the radial scale
to	maximum age limit of the radial scale
t0	central value
transformation	one of either `log`, `linear` or (if x has class `fissiontracks`)
sigdig	the number of significant digits of the numerical values reported in the title of the graphical output.
show.numbers	boolean flag (TRUE to show grain numbers)
pch	plot character (default is a filled circle)

levels	a vector with additional values to be displayed as different background colours of the plot symbols.
bg	a vector of two background colours for the plot symbols. If levels=NA, then only the first colour will be used. If levels is a vector of numbers, then bg is used to construct a colour ramp.
title	add a title to the plot?
k	number of peaks to fit using the finite mixture models of Galbraith and Green (1993). Setting k='auto' automatically selects an optimal number of components based on the Bayes Information Criterion (BIC). Setting k='min' estimates the minimum value using a three parameter model consisting of a Normal distribution truncated by a discrete component.
markers	vector of ages of radial marker lines to add to the plot.
alpha	cutoff value for confidence intervals
exterr	propagate the external sources of uncertainty into the mixture model errors?
type	scalar indicating whether to plot the ^{207}Pb/^{235}U age (type=1), the ^{206}Pb/^{238}U age (type=2), the ^{207}Pb/^{206}Pb age (type=3), the ^{207}Pb/^{206}Pb-^{206}Pb/^{238}U age (type=4), or the (Wetherill) concordia age (type=5)
cutoff.76	the age (in Ma) below which the ^{206}Pb/^{238}U and above which the ^{207}Pb/^{206}Pb age is used. This parameter is only used if type=4.
cutoff.disc	two element vector with the maximum and minimum percentage discordance allowed between the ^{207}Pb/^{235}U and ^{206}Pb/^{238}U age (if ^{206}Pb/^{238}U < cutoff.76) or between the ^{206}Pb/^{238}U and ^{207}Pb/^{206}Pb age (if ^{206}Pb/^{238}U > cutoff.76). Set cutoff.disc=NA if you do not want to use this filter.
common.Pb	apply a common lead correction using one of three methods:
	1: use the isochron intercept as the initial Pb-composition
	2: use the Stacey-Kramer two-stage model to infer the initial Pb-composition
	3: use the Pb-composition stored in settings('iratio','Pb206Pb204') and settings('iratio','Pb207Pb204')
i2i	'isochron to intercept': calculates the initial (aka 'inherited', 'excess', or 'common') ^{40}Ar/^{36}Ar, ^{207}Pb/^{204}Pb, ^{87}Sr/^{86}Sr, ^{143}Nd/^{144}Nd, ^{187}Os/^{188}Os or ^{176}Hf/^{177}Hf ratio from an isochron fit. Setting i2i to FALSE uses the default values stored in settings('iratio',...) or zero (for the Pb-Pb method). When applied to data of class ThU, setting i2i to TRUE applies a detrital Th-correction.

read.data	*Read geochronology data*

Description

Cast a `.csv` file or a matrix into one of `IsoplotR`'s data classes

Usage

```
read.data(x, ...)

## Default S3 method:
read.data(x, method = "U-Pb", format = 1, ...)

## S3 method for class 'matrix'
read.data(x, method = "U-Pb", format = 1, ...)
```

Arguments

x	either a file name (`.csv` format) OR a matrix
...	optional arguments to the `read.csv` function
method	one of `'U-Pb'`, `'Pb-Pb'`, `'Ar-Ar'`, `'detritals'`, Rb-Sr, Sm-Nd, Re-Os, Th-U, `'U-Th-He'`, `'fissiontracks'` or `'other'`
format	formatting option, depends on the value of `method`.

if method=`'U-Pb'`, then `format` is one of either:

1. 7/5, s[7/5], 6/8, s[6/8], rho
2. 8/6, s[8/6], 7/6, s[7/6] (, rho)
3. X=7/6, s[X], Y=7/5, s[Y], Z=6/8, s[Z] (, rho[X,Y]) (, rho[Y,Z])
4. X=7/5, s[X], Y=6/8, s[Y], Z=4/8, rho[X,Y], rho[X,Z], rho[Y,Z]
5. X=8/6, s[X], Y=7/6, s[Y], Z=4/6, rho[X,Y], rho[X,Z], rho[Y,Z]
6. 7/5, s[7/5], 6/8, s[6/8], 4/8, s[4/8], 7/6, s[7/6], 4/7, s[4/7], 4/6, s[4/6]

where optional columns are marked in round brackets

if method=`'Pb-Pb'`, then `format` is one of either:

1. 6/4, s[6/4], 7/4, s[7/4], rho
2. 4/6, s[4/6], 7/6, s[7/6], rho
3. 6/4, s[6/4], 7/4, s[7/4], 7/6, s[7/6]

if method=`'Ar-Ar'`, then `format` is one of either:

1. 9/6, s[9/6], 0/6, s[0/6], rho (, 39)
2. 6/0, s[6/0], 9/0, s[9/0] (, rho) (, 39)
3. 9/0, s[9/0], 6/0, s[6/0], 9/6, s[9/6] (, 39)

if method=`'Rb-Sr'`, then `format` is one of either:

1. Rb87/Sr86, s[Rb87/Sr86], Sr87/Sr86, s[Sr87/Sr86] (, rho)

2. `Rb, s[Rb], Sr, s[Sr], Sr87/Sr86, s[Sr87/Sr86]`

where `Rb` and `Sr` are in ppm

if method=`'Sm-Nd'`, then format is one of either:

1. `Sm147/Nd144, s[Sm147/Nd144], Nd143/Nd144, s[Nd143/Nd144] (, rho)`
2. `Sm, s[Sm], Nd, s[Nd], Nd143/Nd144, s[Nd143/Nd144]`

where `Sm` and `Nd` are in ppm

if method=`'Re-Os'`, then format is one of either:

1. `Re187/Os188, s[Re187/Os188], Os187/Os188, s[Os187/Os188] (, rho)`
2. `Re, s[Re], Os, s[Os], Os187/Os188, s[Os187/Os188]`

where `Re` and `Os` are in ppm

if method=`'Lu-Hf'`, then format is one of either:

1. `Lu176/Hf177, s[Lu176/Hf177], Hf176/Hf177, s[Hf176/Hf177] (, rho)`
2. `Lu, s[Lu], Hf, s[Hf], Hf176/Hf177, s[Hf176/Hf177]`

where `Lu` and `Hf` are in ppm

if method=`'Th-U'`, then format is one of either:

1. `X=8/2, s[X], Y=4/2, s[Y], Z=0/2, s[Z], rho[X,Y], rho[X,Z], rho[Y,Z]`
2. `X=2/8, s[X], Y=4/8, s[Y], Z=0/8, s[Z], rho[X,Y], rho[X,Z], rho[Y,Z]`

where all values are activity ratios

if method=`'fissiontracks'`, then format is one of either:

1. the External Detector Method (EDM), which requires a ζ-calibration constant and its uncertainty, the induced track density in a dosimeter glass, and a table with the spontaneous and induced track densities.
2. LA-ICP-MS-based fission track data using the ζ-calibration method, which requires a 'session ζ' and its uncertainty and a table with the number of spontaneous tracks, the area over which these were counted and one or more U/Ca- or U-concentration measurements and their analytical uncertainties.
3. LA-ICP-MS-based fission track data using the 'absolute dating' method, which only requires a table with the the number of spontaneous tracks, the area over which these were counted and one or more U/Ca- or U-concentration measurements and their analytical uncertainties.

Details

IsoplotR provides the following example input files:

- U-Pb: `UPb1.csv`, `UPb2.csv`, `UPb3.csv`, `UPb4.csv`, `UPb5.csv`, `UPb6.csv`
- Pb-Pb: `PbPb1.csv`, `PbPb2.csv`, `PbPb3.csv`
- Ar-Ar: `ArAr1.csv`, `ArAr2.csv`, `ArAr3.csv`
- Re-Os: `ReOs1.csv`, `ReOs2.csv`
- Sm-Nd: `SmNd1.csv`, `SmNd2.csv`
- Rb-Sr: `RbSr1.csv`, `RbSr2.csv`
- Lu-Hf: `LuHf1.csv`, `LuHf2.csv`

- Th-U: `ThU1.csv`, `ThU2.csv`, `ThU3.csv`, `ThU4.csv`
- fissiontracks: `FT1.csv`, `FT2.csv`, `FT3.csv`
- U-Th-He: `UThHe.csv`, `UThSmHe.csv`
- detritals: `Namib.csv`
- other: `MountTom.csv`, `average.csv`, `spectrum.csv`

The contents of these files can be viewed using the `system.file(...)` function.

Value

an object of class `UPb`, `PbPb`, `ArAr`, `UThHe`, `ReOs`, `SmNd`, `RbSr`, `LuHf`, `detritals`, `fissiontracks`, `ThU` or `other`

Examples

```
file.show(system.file("spectrum.csv",package="IsoplotR"))

f1 <- system.file("UPb1.csv",package="IsoplotR")
d1 <- read.data(f1,method="U-Pb",format=1)
concordia(d1)

f2 <- system.file("ArAr1.csv",package="IsoplotR")
d2 <- read.data(f2,method="Ar-Ar",format=1)
agespectrum(d2)

f3 <- system.file("ReOs1.csv",package="IsoplotR")
d3 <- read.data(f3,method="Re-Os",format=1)
isochron(d2)

f4 <- system.file("FT1.csv",package="IsoplotR")
d4 <- read.data(f4,method="fissiontracks",format=1)
radialplot(d4)

f5 <- system.file("UThSmHe.csv",package="IsoplotR")
d5 <- read.data(f5,method="U-Th-He")
helioplot(d5)

f6 <- system.file("ThU2.csv",package="IsoplotR")
d6 <- read.data(f6,method="Th-U",format=2)
evolution(d6)

#  one detrital zircon U-Pb file (detritals.csv)
f7 <- system.file("Namib.csv",package="IsoplotR")
d7 <- read.data(f7,method="detritals")
kde(d7)

#  three 'other' files (MountTom.csv, spectrum.csv, average.csv)
f8 <- system.file("MountTom.csv",package="IsoplotR")
d8 <- read.data(f8,method="other")
radialplot(d8)
```

Calculate the zeta calibration coefficient for fission track dating

Description

Determines the zeta calibration constant of a fission track dataset (EDM or LA-ICP-MS) given its true age and analytical uncertainty.

Usage

```
set.zeta(x, tst = c(0, 0), exterr = TRUE, update = TRUE, sigdig = 2)
```

Arguments

x	an object of class `fissiontracks`
tst	a two-element vector with the true age and its standard error
exterr	logical flag indicating whether the external uncertainties associated with the age standard or the dosimeter glass (for the EDM) should be accounted for when propagating the uncertainty of the zeta calibration constant.
update	logical flag indicating whether the function should return an updated version of the input data, or simply return a two-element vector with the calibration constant and its standard error.
sigdig	number of significant digits

Value

an object of class `fissiontracks` with an updated `x$zeta` value

References

Vermeesch, P., 2017. Statistics for LA-ICP-MS based fission track dating. Chemical Geology, 456, pp.19-27.

Examples

```
data(examples)
print(examples$FT1$zeta)
FT <- set.zeta(examples$FT1,tst=c(250,5))
print(FT$zeta)
```

---

settings   *Load settings to and from json*

Description

Get and set preferred values for decay constants, isotopic abundances, molar masses, fission track etch efficiences, and etchable lengths, and mineral densities, either individually or via a `.json` file format.

Usage

```
settings(setting = NA, ..., fname = NA)
```

Arguments

setting   unless fname is provided, this should be one of either:

                          `'lambda'`: to get and set decay constants

                          `'iratio'`: isotopic ratios

                          `'imass'`: isotopic molar masses

                          `'mindens'`: mineral densities

                          `'etchfact'`: fission track etch efficiency factors

                          `'tracklength'`: equivalent isotropic fission track length

...   depends on the value for `setting`:

- for `'lambda'`: the isotope of interest (one of either `"fission"`, `"U238"`, `"U235"`, `"U234"`, `"Th232"`, `"Th230"`, `"Re187"`, `"Sm147"`, `"Rb87"`, `"Lu176"`, or `"K40"`) PLUS (optionally) the decay constant value and its analytical error. Omitting these two numbers simply returns the existing values.

- for `'iratio'`: the isotopic ratio of interest (one of either `"Ar40Ar36"`, `"Ar38Ar36"`, `"Rb85Rb87"`, `"Sr88Sr86"`, `"Sr87Sr86"`, `"Sr84Sr86"`, `"Re185Re187"`, `"Os184Os192"` `"Os186Os192"`, `"Os187Os192"`, `"Os188Os192"`, `"Os189Os192"`, `"Os190Os192"`, `"U238U235"`, `"Sm144Sm152"`, `"Sm147Sm152"`, `"Sm148Sm152"`, `"Sm149Sm152"`, `"Sm150Sm152"`, `"Sm154Sm152"`, `"Nd142Nd144"`, `"Nd143Nd144"`, `"Nd145Nd144"`, `"Nd146Nd144"`, `"Nd148Nd144"`, `"Nd150Nd144"`, `"Lu176Lu175"`, `"Hf174Hf177"`, `"Hf176Hf177"`, `"Hf178Hf177"`, `"Hf179Hf177"`, `"Hf180Hf177"`) PLUS (optionally) the isotopic ratio and its analytical error. Omitting these two numbers simply returns the existing values.

- for `'imass'`: the (isotopic) molar mass of interest (one of either `"U"`, `"Rb"`, `"Rb85"`, `"Rb87"`, `"Sr84"`, `"Sr86"`, `"Sr87"`, `"Sr88"`, `"Re"`, `"Re185"`, `"Re187"`, `"Os"`, `"Os184"`, `"Os186"`, `"Os187"`, `"Os188"`, `"Os189"`, `"Os190"`, `"Os192"`, `"Sm"`, `"Nd"`, `"Lu"`, `"Hf"`) PLUS (optionally) the molar mass and its analytical error. Omitting these two numbers simply returns the existing values.

- for `'mindens'`: the mineral of interest (one of either `"apatite"` or `"zircon"`) PLUS the mineral density. Omitting this number simply returns the existing value.

- 'etchfact': the mineral of interest (one of either "apatite" or "zircon") PLUS the etch efficiency factor. Omitting this number simply returns the existing value.
- 'tracklength': the mineral of interest (one of either "apatite" or "zircon") PLUS the equivalent isotropic fission track length. Omitting this number simply returns the existing value.

fname   the path of a .json file

Value

if setting=NA and fname=NA, returns a .json string

if ... contains only the name of an isotope, isotopic ratio, element, or mineral and no new value, settings returns either a scalar with the existing value, or a two-element vector with the value and its uncertainty.

titterington   *Linear regression of X,Y,Z-variables with correlated errors*

Description

Implements the maximum likelihood algorithm of Ludwig and Titterington (1994)

Usage

```
titterington(x, alpha = 0.05)
```

Arguments

x   a [9 x n] matrix with the following columns: X, sX, Y, sY, Z, sZ,
                rhoXY, rhoXZ, rhoYZ.

alpha   cutoff value for confidence intervals

Value

a four-element list of vectors containing:

par 4-element vector c(a,b,A,B) where a is the intercept of the X-Y regression, b is the slope
of the X-Y regression, A is the intercept of the X-Z regression, and B is the slope of the X-Z
regression.

cov [4 x 4]-element covariance matrix of par

mswd the mean square of the residuals (a.k.a 'reduced Chi-square') statistic

Geochimica et Cosmochimica Acta, 58(22), pp.5031-5042.

---

weightedmean   *Calculate the weighted mean age*

Description

Models the data as a Normal distribution with two sources of variance. Estimates the mean and
'overdispersion' using the method of Maximum Likelihood. Computes the MSWD of a Normal
fit without overdispersion. Implements Chauvenet's Criterion to detect and reject outliers. Only
propagates the analytical uncertainty associated with decay constants and J-factors after computing
the weighted mean isotopic composition.

Usage

```
weightedmean(x, ...)

## Default S3 method:
weightedmean(x, detect.outliers = TRUE, plot = TRUE,
  rect.col = rgb(0, 1, 0, 0.5), outlier.col = rgb(0, 1, 1, 0.5),
  sigdig = 2, alpha = 0.05, ...)

## S3 method for class 'UPb'
weightedmean(x, detect.outliers = TRUE, plot = TRUE,
```

```
  rect.col = rgb(0, 1, 0, 0.5), outlier.col = rgb(0, 1, 1, 0.5),
  sigdig = 2, type = 4, cutoff.76 = 1100, cutoff.disc = c(-15, 5),
  alpha = 0.05, exterr = TRUE, common.Pb = 0, ...)

## S3 method for class 'PbPb'
weightedmean(x, detect.outliers = TRUE, plot = TRUE,
  rect.col = rgb(0, 1, 0, 0.5), outlier.col = rgb(0, 1, 1, 0.5),
  sigdig = 2, alpha = 0.05, exterr = TRUE, i2i = FALSE, ...)

## S3 method for class 'ThU'
weightedmean(x, detect.outliers = TRUE, plot = TRUE,
  rect.col = rgb(0, 1, 0, 0.5), outlier.col = rgb(0, 1, 1, 0.5),
  sigdig = 2, alpha = 0.05, i2i = TRUE, ...)

## S3 method for class 'ArAr'
weightedmean(x, detect.outliers = TRUE, plot = TRUE,
  rect.col = rgb(0, 1, 0, 0.5), outlier.col = rgb(0, 1, 1, 0.5),
  sigdig = 2, alpha = 0.05, exterr = TRUE, i2i = FALSE, ...)

## S3 method for class 'ReOs'
weightedmean(x, detect.outliers = TRUE, plot = TRUE,
  rect.col = rgb(0, 1, 0, 0.5), outlier.col = rgb(0, 1, 1, 0.5),
  sigdig = 2, alpha = 0.05, exterr = TRUE, i2i = TRUE, ...)

## S3 method for class 'SmNd'
weightedmean(x, detect.outliers = TRUE, plot = TRUE,
  rect.col = rgb(0, 1, 0, 0.5), outlier.col = rgb(0, 1, 1, 0.5),
  sigdig = 2, alpha = 0.05, exterr = TRUE, i2i = TRUE, ...)

## S3 method for class 'RbSr'
weightedmean(x, detect.outliers = TRUE, plot = TRUE,
  rect.col = rgb(0, 1, 0, 0.5), outlier.col = rgb(0, 1, 1, 0.5),
  sigdig = 2, alpha = 0.05, exterr = TRUE, i2i = TRUE, ...)

## S3 method for class 'LuHf'
weightedmean(x, detect.outliers = TRUE, plot = TRUE,
  rect.col = rgb(0, 1, 0, 0.5), outlier.col = rgb(0, 1, 1, 0.5),
  sigdig = 2, alpha = 0.05, exterr = TRUE, i2i = TRUE, ...)

## S3 method for class 'UThHe'
weightedmean(x, detect.outliers = TRUE, plot = TRUE,
  rect.col = rgb(0, 1, 0, 0.5), outlier.col = rgb(0, 1, 1, 0.5),
  sigdig = 2, alpha = 0.05, ...)

## S3 method for class 'fissiontracks'
weightedmean(x, detect.outliers = TRUE, plot = TRUE,
  rect.col = rgb(0, 1, 0, 0.5), outlier.col = rgb(0, 1, 1, 0.5),
  sigdig = 2, alpha = 0.05, exterr = TRUE, ...)
```

Arguments

x	a two column matrix of values (first column) and their standard errors (second column) OR an object of class `UPb`, `PbPb`, `ArAr`, `ReOs`, `SmNd`, `RbSr`, `LuHf`, `ThU`, `fissiontracks` or `UThHe`
...	optional arguments
detect.outliers	
	logical flag indicating whether outliers should be detected and rejected using Chauvenet's Criterion.
plot	logical flag indicating whether the function should produce graphical output or return numerical values to the user.
rect.col	the fill colour of the rectangles used to show the measurements or age estimates.
outlier.col	if `detect.outliers=TRUE`, the outliers are given a different colour.
sigdig	the number of significant digits of the numerical values reported in the title of the graphical output.
alpha	the confidence limits of the error bars/rectangles.
type	scalar indicating whether to plot the $^{207}Pb/^{235}U$ age (type=1), the $^{206}Pb/^{238}U$ age (type=2), the $^{207}Pb/^{206}Pb$ age (type=3), the $^{207}Pb/^{206}Pb$-$^{206}Pb/^{238}U$ age (type=4), or the (Wetherill) concordia age (type=5)
cutoff.76	the age (in Ma) below which the $^{206}Pb/^{238}U$ age and above which the $^{207}Pb/^{206}Pb$ age is used. This parameter is only used if type=4.
cutoff.disc	two element vector with the maximum and minimum percentage discordance allowed between the $^{207}Pb/^{235}U$ and $^{206}Pb/^{238}U$ age (if $^{206}Pb/^{238}U$ < cutoff.76) or between the $^{206}Pb/^{238}U$ and $^{207}Pb/^{206}Pb$ age (if $^{206}Pb/^{238}U$ > cutoff.76). Set cutoff.disc=NA if you do not want to use this filter.
exterr	propagate decay constant uncertainty?
common.Pb	apply a common lead correction using one of three methods: 1: use the isochron intercept as the initial Pb-composition 2: use the Stacey-Kramer two-stage model to infer the initial Pb-composition 3: use the Pb-composition stored in `settings('iratio','Pb206Pb204')` and `settings('iratio','Pb207Pb204')`
i2i	'isochron to intercept': calculates the initial (aka 'inherited', 'excess', or 'common') $^{40}Ar/^{36}Ar$, $^{207}Pb/^{204}Pb$, $^{87}Sr/^{86}Sr$, $^{143}Nd/^{144}Nd$, $^{187}Os/^{188}Os$ or $^{176}Hf/^{177}Hf$ ratio from an isochron fit. Setting i2i to FALSE uses the default values stored in `settings('iratio',...)` or zero (for the Pb-Pb method). When applied to data of class `ThU`, setting i2i to TRUE applies a detrital Th-correction.

Value

if PLOT=FALSE, returns a list with the following items:

mean a two element vector with the weighted mean and its standard error.

disp a two element vector with the (over)dispersion and its standard error.

mswd the Mean Square of the Weighted Deviates (a.k.a. 'reduced Chi-square' statistic)

p.value the p-value of a Chi-square test with n-1 degrees of freedom, testing the null hypothesis that the underlying population is not overdispersed.

valid vector of logical flags indicating which steps are included into the weighted mean calculation

Examples

```
ages <- c(251.9,251.59,251.47,251.35,251.1,251.04,250.79,250.73,251.22,228.43)
errs <- c(0.28,0.28,0.63,0.34,0.28,0.63,0.28,0.4,0.28,0.33)
weightedmean(cbind(ages,errs))
data(examples)
weightedmean(examples$ArAr)
```

---

york   *Linear regression of X,Y-variables with correlated errors*

Description

Implements the unified regression algorithm of York et al. (2004) which, although based on least squares, yields results that are consistent with maximum likelihood estimates of Titterington and Halliday (1979)

Usage

```
york(x, alpha = 0.05)
```

Arguments

x   a 5-column matrix with the X-values, the analytical uncertainties of the X-values, the Y-values, the analytical uncertainties of the Y-values, and the correlation coefficients of the X- and Y-values.

alpha   cutoff value for confidence intervals

Value

a four-element list of vectors containing:

a the intercept of the straight line fit and its standard error

b the slope of the fit and its standard error

cov.ab the covariance of the slope and intercept

mswd the mean square of the residuals (a.k.a 'reduced Chi-square') statistic
